

Facilities, Equipment, and Other Resources

The proposed workshop will be hosted at George Mason University’s Mason Square campus in Arlington, Virginia. Mason Square is located in the Washington, D.C. metropolitan area, providing convenient access to federal agencies, industry partners, standards organizations, and research institutions. The campus is directly accessible via the Washington Metro system and is located near Ronald Reagan Washington National Airport, facilitating participation from attendees across academia, industry, and government.

Moreover, the workshop will specifically be held at the *FUSE* building at Mason Square, which is George Mason University’s state-of-the-art innovation and collaboration hub. FUSE is a 345,000-square-foot facility designed to support advanced research, education, entrepreneurship, and industry engagement in areas including artificial intelligence, cybersecurity, data analytics, networking, and next-generation communications. The facility provides modern conference venues, flexible meeting spaces, classrooms, collaborative work areas, and advanced audiovisual infrastructure suitable for hosting keynote presentations, panel discussions, breakout sessions, and hybrid participation.

FUSE was specifically designed to promote collaboration among researchers, students, industry partners, entrepreneurs, and government stakeholders. The facility hosts interdisciplinary research activities and innovation programs that align closely with the workshop’s focus on the security and resilience of future non-terrestrial and integrated terrestrial-satellite communication systems. Its location within the Rosslyn–Ballston innovation corridor provides additional opportunities for engagement with technology companies, federal agencies, and regional research organizations.

The workshop organizers will have access to meeting spaces, presentation facilities, wireless networking infrastructure, and administrative support necessary to successfully conduct the proposed event. The facility provides sufficient capacity and technical resources to accommodate all planned workshop activities, including invited talks, panel discussions, breakout sessions, and networking events. No specialized equipment beyond standard conference and audiovisual support is required.

George Mason University’s College of Science will provide organizational support for the workshop, including participant coordination, registration management, dissemination activities, and post-workshop reporting. In collaboration with George Mason University’s Department of Electrical and Computer Engineering, faculty expertise on wireless communications, cybersecurity, networking, and emerging communication systems will further contribute to the successful execution of the workshop.
